Couponel

Is a project that locates the best deals in town, helping students to save money when they need it the most, but still enjoying the good life.

The purpose of our application is to have an exclusive selection of student discounts, covering everything from men's & women's fashion, to health and beauty discounts, restaurants, outdoor activities and much more.

We have to build a web application that will help users save money with epic student discounts.

The students would like to have the possibility to save vouchers, leave comments based on their experience, rate, but this can be done only after being logged into the application.

Vouchers functionality should give user the possibility to add store name, voucher code, discount description, category, expiration date, images or links. The others will see also by who was added and when.

The application should have a modern layout, easy to follow, respect the accessibility demands and it can be accessed from laptop, desktop and mobile devices.

If a user saved a voucher and the expiration date is near, he/she will be notified.

Filtering options should be taken into consideration, examples: travel, sport & outdoors, health & beauty, restaurant, technology and much more. A top list with the most used vouchers will be nice to see.

For the evaluation, among others, it will be taken in consideration the project complexity, design (UI), user experience (UX), code quality, testing, team interaction and demo.

Also, any other functionality implemented that hasn't been described will be taken in consideration.
